

PR2.F – Caso di Studio - Obesità

Descrizione del Caso

Un paziente maschio di 16 anni si presenta per una valutazione dietetica, accompagnato dalla madre.

Durante la visita, attraverso determinazioni antropometriche, viene determinato un peso di 79,3 kg, un'altezza di 168 cm, una circonferenza addominale di 93 cm e una piega addominale di 39 mm. Al momento della valutazione, il paziente non presentava patologie croniche.

- L'anamnesi mostra un'eccessiva assunzione di cibo, dovuta allo stress, e un numero di ore di sonno pari a 4,5-5 ore per notte.
- Non dichiara comportamenti a rischio (fumo, abuso di alcol o droghe)
- Non dichiara il consumo di integratori alimentari o medicinali
- In base a un questionario di frequenza alimentare, si osserva un elevato consumo di prodotti a base di farina raffinata, formaggi stagionati, piatti zuccherati, frutti di mare e insaccati.
- Pasti irregolari, idratazione ridotta (meno di 1000 ml di acqua al giorno); il consumo di liquidi è basato su bevande zuccherate e prodotti gassati
- Il livello di attività fisica è stato autodefinito molto basso, senza attività sportive organizzate o pianificate.

Domande

Utilizzando le informazioni fornite, determinare:

- la situazione antropometrica del paziente in relazione all'età
- il fabbisogno energetico per mantenere il peso attuale
- il fabbisogno nutrizionale (calorie e macronutrienti) per il riequilibrio ponderale
- le raccomandazioni di base per l'attività fisica
- aspettative a breve termine (10 settimane)
- approccio dietetico in caso di mancato raggiungimento dell'obiettivo prefissato
- aspettative a lungo termine (2 anni)

Example of a dietary approach to the presented case

Anthropometric and nutritional assessment

According to the theoretical data used, a normal resting metabolic rate and a total caloric requirement for maintenance of 2749 kcal/day are established.

- Low-intensity physical activity programme with interspersed moderate activity: walking/cycling/swimming, 60 minutes/day, with breaks according to tolerance + bodyweight activity for the upper trend
- A varied food plan is initiated, with all food groups, 3 main meals + 2 snacks, with an average of 1750 kcal/day
- Behavioral therapy is recommended

Evaluation at an interval of ≈ 2 years

- Weight: 68.1 kg
- Height: 172 cm
- Abdominal circumference: 71 cm
- Physical activity level: moderately active, constant
- Increased self-esteem and confidence
- Positive integration into society
- Healthy relationship with food, predominating nutritious foods
- No yo-yo effect
- Improved rest level (over 7 hours of sleep per night)
